Nice find. Yes, we need more people using these kind of gadgets to get high quality video.

Some of us have been using the Elgato HD60(s), which does a good job too.

If someone's considering getting an Elgato, I recommend getting the HD60 and NOT the HD60s. I got the HD60s hoping that the latency was low enough that I could actually use the Amiga while viewing it on the laptop. However, the latency is still too high. Even worse, it requires USB3, and my laptop's USB3 ports were suddenly downgraded to USB2 for a few months until another Windows update restored USB3 capability. The HD60 model has a built in encoder which can handle higher frame-rates than having the raw frames piped through USB3, and then encoded on the computer.
