For live (rather than timelapse) recordings I use an EZCAP box, forget the exact model number at the moment, but I connect it to the HDMI output of my gfx card, whilst the DVI output connects to my monitor. This way I get absolutely lag free display. It records at upto 1080p 30fps.

It has two disadvantages, if you change screen resolution it starts to record a new video file, but that file is always empty. I always use full 1080p mode for the things I record anyway so no issue in practice.

The other issue is that you can't record audio from the audio inputs if using the HDMI input. This means I have to record the audio seperatly on my SAM.

Biggest advantage is that it needs no external PC just saves the video to a FAT32 USB stick in mp4 format. That can be easily imported into my X1k for editing in blender.
