You should have the check/repair command "NGFCheck" in C:. I suggest you enter a command like this:

NGFCheck Work: list

It will check the whole partition for you and print out a list of all the errors it finds. There may be some that you prefer to repair yourself and some that NGFCheck can be left to repair automatically.

NGFCheck has docs in Documentation/C/. Use Multiview or your favourite reader to display them.

Please tell me the version of NGFileSystem you have there. I can't be sure any more which was released at that time. I can then tell you what "Error 1060" means (the actual error value may have changed since then). Just enter "version full NGFileSystem" in a Shell.

Note that the version of NGFileSystem distributed with the X-5000 OS is well out of date. It was released as the only alternative to FFS (at the time). The current version is much more advanced and I hope it will be released one day soon.
