USB Joypad problem

I have bought a Snes usb joypad clone that works fine under Windows. On the AmigaOS 4 side it is recognized from the system and it partially works but there is a problem when I plugged into my Amigaone system. Under AmigaInput when I try to calibrate it, a requester appears and says:"This AmigaInput unit is not configurable - Problems with Axis Pair components in LIBS:AmigaInput/Generic_usb.driver .. Indeed when i try to play some games with, for example, vice, I can move the player one in all directions except down.. or some time the player stay down.. is there any workaround for this problem?
