I can't answer if it possible to have 2 cards at the same time and switch between them, but i can say that if you want normal support of minigl and old warp3d right now together with warp3dNOVA and ogles2, then you need for sure go for some RadeonSI card.

At the moment if i remember things right, the best/fast card which have support of everything are R9 270X. I for myself have some r7-250 (marked as HD Verde), which proven to be good for everything on x5k.

Dunno about r5-230, go for r7-250 at minimum, and if possible r9-270x, but it cost twice more, if i remember right.

And you will need new driver for new card to make minigl and old warp3d works. I do not know if they come with Enhancer 2.0 (or with any Enhancer) probabaly not, and you need to buy it separately. On amistore called "RadeonHD SI warp3d driver" if i remember right.
