@Hans

Thanks for exhausting reply :)

Judging by you starting this thread, I'm guessing that Wazp3D's experimental Warp3D Nova backend isn't performing well enough yet?

It seems to be very buggy at this state. It shows lots of artefacts and it is slow, so unusable on things I've tried so far

Quote:

Ultimately, whether it's worth it or not depends on what you want to do.

Basically everything... Play older/newer games, watch movies, development mainly for OGLES/W3D_Nova.. I thought the best option would be the Radeon RX but it is missing a lot of features at the moment

So the best option at this state regarding compatibility and features will be Radeon R7/R9 with W3D_SI drivers if I understand correctly?

Is it compatible also with W3D_Nova, or is this specific only for Radeon RX gpus?
