So the best option at this state regarding compatibility and features will be Radeon R7/R9 with W3D_SI drivers if I understand correctly?

Is it compatible also with W3D_Nova, or is this specific only for Radeon RX gpus?

Of course, as i told before when you got r7/r9 then everything works for you. And old stuff, and new one (include ogles2 and warp3dnova of course). I have r250x and everything works (old warp3d, old minigl, gl4es, ogles2, warp3dnova, whatever else)

Hans do warp3dnova firstly for SI cards, only later for for RX ones.
