Basically everything... Play older/newer games, watch movies, development mainly for OGLES/W3D_Nova.. I thought the best option would be the Radeon RX but it is missing a lot of features at the moment

The only missing feature for Radeon RX is legacy Warp3D drivers. All other features are present,** and it comes with the bonus of dynamic power management (i.e., the GPU is clocked up and down based on GPU load).

The lack of legacy Warp3D drivers should be solved once Wazp3D's Warp3D Nova backend is finished and MGLReloaded is done.

Hans

** As in, it has everything that the RadeonHD.chip driver has, and There are also Warp3D Nova drivers.
