- 1) I fetched the latest ScummVM sources from master, built it with my old configuration and it is using SDL2.
- 2) Since I couldn't find a configure switch to use SDL1, I hacked config.mk, commenting out whole "USE\_SDL2=" line.
- 3) Then I modified include and linker line for SDL1 in config.mk.
- 4) Make clean + make
- 5) There was some compiler error regarding Image::writePNG - I simply removed USE\_PNG temporarily because have no time to investigate that (could be my GCC4 or something else).
- 6) I also removed SDL\_NET usage but just because I don't have the SDK installed currently.

Please try steps 1-4.
