I have a Radeon 9256 with 256 MB in my A1XE G4. In earlier versions of AmigaOS 4.x, I would only see 128 MB. Then, at some point, there was an upgrade that allowed me to see all 256 MB.

I don't think I did anything other than update my version of OS4 (and now on FE). It just became available.

I don't know if it's a limitation of the G3-SE, or perhaps your card and mine are different in the way they address the extra memory.

Having said that, if I try and use more than 128 MB (usually by opening multiple screens, one of them being Odyssey), I invariably get GFX corruption.
