I've worked on the code in deadwood's repo. Trying to gather all dependencies and build it. I've setup a docker container with a cross-compiler setup, SDK and a script that downloads and installs the dependencies. See the readme for instructions. Anyone with docker should be able to try it out.

For now there's a missing dependency, libicu, in my list, but I'll try and fix that tonight.

I've merged the changes done by the Aros team, and my plan is to have it build, and then try and update to the next revision that the TenFourFox/leopard ppc-safari has a JIT-patch for.

I'm however currently stuck on freetype/fontconfig dependency, which I don't know if the latest libcairo by salass00 has support for (the port only mentions an Amiga font backend).
