@Daniel

Issue with freezes on running of different minigl apps happens also and with your libraries from precompiled\_bins.7z.

For example, i run 5-6 times testgl, then trying to run Cube : os freezes.

With 2.20 and 2.21 all fine.

Can you also build 2.22 for tests so we can rule out versions ?

Probably it can start happens after that heavy refactoring with removing allocvecs, adding tabor, etc , etc.
