Yeah, its not demo broken, but datafiles, all *.ppm datafiles are of different size than those ones from 2.20. I assume they was auto-regenerated and maybe not on amigaos, but on some crosscompiler setup, and maybe that change them a little, dunno.

All the *.png files remain the same of size as in 2.20 archive, but all *.ppm files are of different size now (except one: lwap.ppm, its have the same as original size, all other changes on some bytes).
