@ddni

Tried your config : for me lightsaber looks blocking and with 2.20 and with 2.23 with your config. It didn't looks scretched, just a bit blocky (because in your config in MoreVideo/Brightness option it set to maximum, but slider should be on about 20%). But then i see no difference with 2.20 and 2.23 in that case.

Can you show a screenshot of how it looks like on your setup wth your config on 2.20, and then on 2.23 ?

@Daniel

It should runs for sure , we use OpenJK (Jedi Academy):

<http://bszili.morphos.me/ports/openjk-os4.lha>

And over it installed data from the original CDs , from which you got just:

assets0.pk3 - 561.806.019

assets1.pk3 - 652.804.510

assets2.pk3 - 1.116.384

and patch which is just:

assets3.pk3 - 9.282.026

taken there:

<http://www.x-raiders.net/download/?file=assets3>

It may freeze when you use very hight textures, or sometime freezes when you just change video settings on the fly and reapply them, but it for sure starts and i didn't have checksum erros (which probabaly can be just becaues of badly copied file, or wrong ones maybe from Jedi Outcast ?)
