@Hans

So it should be 2 modules, one for ogles2.library and another one for warp3dnova (?)

As far as i can see, apitrace can be running with providing as arguments what api will be traced, so it can be and only ogles2, an only warp3dnova, and both at the same time.

And probabaly making "tracing" will be easy, harder will be replaying and viewing.

But even pure "tracing" for both libraries will be also nice to have, it will then dump the lists of ogles2/ w3d calls with their arguments / offsets , and even that info will help to see when and how many and what was called
