Thank you, that fixed it too.

Using 0.5f instead of 1.0f gives me an instant lockup of the whole system (when i start the game).

Actually so bad that it takes at least 5-7 minutes to bring it up again.

Nothing on console or serial.

Seems to be locking up the gfx hardware as numerous (unsuccessful) tries to boot the system up again are stopping at a message that there was no VGA device found (on serial).

I need to turn the whole thing off, let it sit there (power plug out the socket) for some minutes to be able to restart it again.

Not sure if my gfx card is dying (otoh i know this deep lockups from the very first time i got the X1000).

It still is slower than without the patch, but faster than the patch before
