More likely, the constructor functions didn't run in the order you expected. AFAIK, there are no guarantees given on the order that the constructor functions are run. If one constructor relies on another constructor function to have run first, then it may work some of the time, and then mysteriously fail when the compiler changes the execution order.

Another option might be to create a `trace_opengles2.library` that passes on the obtain interface call to the actual `opengles2.library`, and captures the interface pointer before returning it to the application.

Hans
