Yeah loggin to a file are good. Before to speed things up i just use Sashimi with redirect to the >ram:debug.txt , and it create 25-30 megabytes of log pretty quick too. Of course perfomance of the GL app in testing reduced quite well, but at least it usable for sure for real-tests in compare with serial output, which even on 115200 slow things down that much that you can't do anything :)

Are you restricted loggin to a file by 10mb limit ? Imho it should have no limits, just fill it as much as it can till programm which is being debug not exit.
