The AROS implementation of SetFunction does Forbid/Permit internally. The original developer docs also imply that you don't have to manually Forbid/Permit:

http://amigadev.elowar.com/read/ADCD_..._cs_3_guide/node0238.html

As for SetMethod, I'd imagine that it also does whatever locking is needed for you. Still, there's no harm in doing Forbid/Permit around the block where you patch the functions, as you won't end up being rescheduled between the SetMethod calls.
