Did you define NDEBUG when compiling the autoinit code? If so assert() would be defined as a no-op.

No. It's very strange that it did nothing for me, but it works for xenix.

I personally think that assert() shouldn't be used for autoinit code even if it works, because an error message saying "Couldn't open sample.library" is much clearer than an assertion failure message.

Ideally it would open an error requester, but even IDOS->PutErrorStr() makes it clear why it's failing.
