I don't get a "Network device name:" line in the preview pane for Computer. This is with the latest version off os4depot (1.8 01/03/2018).

Interesting arp -a run on my SAM shows my X1000 and my router (fixed ips) but not the Linux laptop or phone that are both using DHCP

I've found that I have to ping another machine before it's listed by arp -a. However, only the router's name appears.
