@Hans

It does seem so.

I did some more testing with the new hardware and i found even more good stuff.

I can access my NAS again in full speed (access speed went down to a crawl with the PCI hw after the router, where the NAS is connected to, got a new firmware update) - fixed now and the access speed is measurable faster too.

Overall web access seems to be faster as well, so it was a good thing trashing the PCI network card.

edit: i read about PCIe network cards reducing cpu load on net access, but i cannot confirm that. Maybe in the background or invisible within the driver, but not measurable with i.e. cpu load docky.
