I was able to confirm the Multiviewer issue you reported. Hopefully, Andy's newer version fixes the issue. I also think I found an issue that occurs in Multiviewer and Multiview. In a rush to confirm your crash, I renamed my USB log (in T:) as text.txt to make the test. Both Multiviewer and Multiview froze my system when I linked to that usb.log file in the AmigaGuide. It's probably a text datatype issue rather than Multiviewer or Multiview. Tommorrow I will try to determine what part of the usb.log causes the problem.
