I have new features turned on by default because from past experience, people don't read the ChangeLog and would never know about them. I am sure you have been asked "Can you add XYZ feature?" "Dude, it was added 2 versions ago."

TBImages:, I may be overlooking some things like it's speed. For my X5000 it takes 14 seconds to load and display it. No crash for me. 8,952 images. With "Show actual icons" checked it took twice as long, still no crash. (I have a 4GB graphics card, though.)

Images column, tied in to above, is forced on. I have always liked the look of a drawer/file next to the items. For the average user and average drawer it is not a big deal. Yes, for drawers with a lot of photos it does slow down. But that falls to the speed of the datatypes loading the image. Scaling is not the slow part. And the drawer/file images are loaded once then copied in memory.

I have debated about allowing the image column to be turned off. I guess I envisioned more people getting X5000s and this not being a real issue. I have it in my notes.
