Sure 😊

So far I've added the -a switch for the commit command which automatically stages files that have been modified and deleted, but ignore new files you have not told Git about.

I'm in the process of adding support for the mv command and setting up the default push behaviour when the repository and refspec aren't specified. Basically I'm plugging the holes of my most common git workflow so I can do:

```
sgit commit -a -m "blah"
```

```
sgit push
```

the same as I do with the standard git command.

Feel free to suggest any features that you are interested in and I'll see what I can do.

cheers

Billy
