URL:

Just to maybe inspire willing Developers, I thought to open a new tread where we can suggest needed software. Of course the obvious for many are a Webbrowser and Office Suite, which I deem too big for a single developer, but I'll list them for completeness.

I will update this first post if suggestions come in, maybe, maybe there could be a poll later on to assign priority.

- Web Browser

- Office Suite (To me an up-to-date Wordworth or Final Writer and TurboCalc would suffice)

- [ignition](#) is being worked on and seems to come along well.

- Gutenprint

- Network Stack

- Update for Synergy Client or Server ([www.symless.com](http://www.symless.com)). *Exists as part of UHCTools -thx smf- but the Meta-key (LAmiga and RAmiga) do not work as of 2019-10-17.*

- **Update:mp3 Tag software** (post #13 #27 #47) *Probably already in AmiStore upload queue.* Thanks @jvp!

- Compare Folders Utility with options to copy, move, rename entries *Partially exists Post #21, #29*

- Duplicate files finder with a nice GUI to automatically select, compare, move and delete duplicates. *WEx has it partially implemented*

- File Renamer. ~~Drop Files to the app, and rename multiple files in an easy way.~~ *Already exists as [MultiRen](#) by OnyxSoft*

- A font engine which supports colour fonts (specifically OTF-SVG)[...] This would mean we get colour scalable fonts, including Emojis. *Post #39*

-Bible App viewer as proposed by Samurai\_Crow on AW [Link to Topic](#) akin to [Bibvision](#)

p.s. Please, any developer do not feel offended, this is not intended to diminish any work you have done so far on any project. Just a list where you can maybe find something interesting to work out.
