How's your work on sgit going?

I've encountered a few more problems:

- sgit revert doesn't work (command "revert" not supported)
- If there are conflicts when merging then it'll simply say: "libgit error (20): n conflicts prevent checkout".

I can't find any way for it to indicate where the conflicts are, let alone how to resolve them

- sgit add . is rather slow. Actually, the larger the repository becomes, the slower the "add", "status" and similar commands become. It gets very noticeable on my Tabor, taking 30s+
