Another idea which maybe you find worth of adding : adding something like profiler-only flag to command line , so, while all the functions will be patches and counted as usuall, log will not be writen anything, but only final profiling information.

By this way, we will be able to avoid slow-downs in heavy games when we want only to know, where all the loading happens, and how much of and of which ones calls are used.

Because when i only need profiling, and even if i redirect loggin via sashimy to RAM:, it still slowdown the games pretty much (not THAT much as if it was writen to serial of course, but still, it reduce fps pretty much, and for some big-slow games, its hard to profile it as you want it).
