Okay, even adding a single file is taking far too long. I have no idea what sgit is doing, but doing sgit add path/to/file should *NOT* take multiple seconds, regardless of the repo size.

@Raziel

Thanks for the workaround for the missing revert command. However, that takes what should be a trivial operation and makes it really tedious.

I see getting sgit up to standard and working fast as one of the many things we need to make development on and for AmigaOS more productive and more fun. Another would be to have a fully working debugger, but that's a whole different story...
