Arrgh, i hate makefiles

I try to port a static library, but it seems i have only one stupid mistake in, since i can create the .a file, but it only consists of

Quote:

```
!<arch>
```

None of the needed source files are compiled in it seems, no matter what i try.

Here's the stripped down makefile, since i need to keep it as easy to understand as i can

```
all: staticlib.a
```

```
OBJ:    lots.o of.o object.o files.o
```

```
staticlib.a:    $(OBJ)  
               ar rcs staticlib.a $(OBJ)
```

```
clean:  
      rm -f *.o *.a
```

Can someone please point out the obvious mistake?

I can't...

With the above makefile the source files are compiled, but the "ar" linker doesn't seem to pick them up. Why?
