Coming back to the ringhio thing . In you most recent test script you put PERCENTAGE with no argument and assumed the default was 0.

PERCENTAGE can not have "no argument" as it's a keyword so the next item on the row is 'eaten' as the argument. In this case it was UPDATE. Adding to your scripts layers of weirdness.

I'm going to set the N flag on all the numerical keywords, so the above would throw an error rather than silently drive you crazy!
