Not bug-report but question / maybe feature request.

Let's say i have directory "picts" with bunch of pictures. Now via workbench i go to it, and dbl-click on one picture -> multiviewer opens. Now, is there any possibility, without doing any other moves, press some key (like space, or left/right) so it will navigate through all pictures this directory have ?

If not, that will be very handy. Or maybe it already possible via settings some default tooltype ?

edit: and yes, selecting font manually / save settings in the multiedit make it works with silvergreen theme. At moment making it as default notepad replacement (because notepad have some bugs with ghosting/unghosting buttons still), will see how it will be :)

edit: is it possible in multiedit to hold "undo" button, so it will undo fast many till i unhold it ? Some option maybe somewhere or tooltype ?
