Starting to use for real Multiviewer and Multiedit : damn, they good after you adapt settings for own needs !

Found that magic "scan directories" setting, so to have ability to navigate over all pics in directory via clicking on just one first time.

Also found that navigate through the files inside of directory are "amiga + ." and "amiga + ," , is it possible to edit via user somehow ? For example i want to attach "amiga + ." on space for example.

And dunno if it bug or not, but : if you run slideshow in the directory , then once it reach last one, it start from the first one in the loop : all fine. But if you use button "next file" , then once it reach last on, it didn't jump on first one as slideshow , while probabaly should.

Also in MultiViewer, seems that keys PgUP/pgDown didn't work when i want to jump over text file. Original Multiviewer can do that, same as MultiEdit.
