Also found that navigate through the files inside of directory are "amiga + ." and "amiga + ," , is it possible to edit via user somehow ? For example i want to attach "amiga + ." on space for example.

They correspond to the '<' and '>' keys. AS they are menu short cuts they are not customisable for the moment.

And dunno if it bug or not, but : if you run slideshow in the directory , then once it reach last one, it start from the first one in the loop : all fine. But if you use button "next file" , then once it reach last on, it didn't jump on first one as slideshow , while probabaly should.

No it doesn't this is by design.

Also in MultiViewer, seems that keys PgUP/pgDown didn't work when i want to jump over text file. Original Multiviewer can do that, same as MultiEdit.

These operate on the file list in MultiViewer
