@Thread

On X1000, I'm using this parameters :

```
#!/python
autoplay = True
verbose = False
vPlayer = "appdir:mplayer-altivec"
vPlayerArgs = "-really-quiet -fixed-vo -forceidx -framedrop -fps 30 -vo comp_yuv2 -ao sdl -autosync 30 -cache 8192"
sPlayer = "APPDIR:ffplay"
sPlayerArgs = "-loglevel quiet -infbuf -skip_frame noref -sync audio"
```

```
twitchQualityWeight = [
"480p30",
"720p30",
"360p30",
"160p30",
"720p60",
"chunked",
"audio_only"
```

*Important for ffplay : -sync audio (it avoids sound hick ups).*

*For Mplayer, it's the best I found to avoid sound hick-ups (there are still some but far less than without these options).*

*This config applies only for X1000 (and maybe X5000).*

*I wish I could use Emotion for everything.*

@Walkero

*Would it be possible to have different parametrers for live streaming and recorded streams ?*

*MPlayer can cope with 720p30 videos whereas ffplay (which would really benefit of a -compyuv2 option too) can only cope with 480p30 videos.*

*Multi-edited to improve Mplayer options*
