It is an old issue, I think. Sometimes after patch removal, application is still making a call to wrapper. OGLES2 wrappers had a NULL pointer check because patching process (SetMethod) might fail. Nova wrappers didn't, because patching (operator=) cannot fail. Now also Nova wrappers have the check and there is some extra logging so "late callers" are seen. Hopefully it fixes the issue. I didn't see the problem with Boing demo which I usually test but FrikinShark was quite easy to crash with CTRL-C.
