Makefile question.

I'd like to automate the process of building and linking a static library.
Can this be done in one makefile?

Right now i have this, but ar is never picked up.

```
CXX          = g++
CXXFLAGS    = -Wall -Wextra -g -gstabs `sdl-config --cflags --static-libs` -std=gnu++11 -ISDK:local/common
              /include/libxml2
SDL_LIBS    = `sdl-config --static-libs`
              -ISDL_image -ltiff -lpng -ljpeg -lwebp
              -ISDL
```

```
OBJS =      lots.o of.o o.o files.o
```

```
libmylib.a: $(OBJS)
    $(CXX) $(LDFLAGS) -o $@ $(OBJS) $(SDL_LIBS) -lm -lz -lpthread
    ar rcsv libmylib.a $(OBJS)
```

```
clean:
```

```
rm -f *.o libmylib.a
```

Thank you
