you can add any of aiostreams scripts in any browser like you do with YT.rexx, but use the **-u** argument and the url link.

For twitch and Mixer, setting them to a browser is not usable because those browsers do not render right. I think the shell search options of the scripts are the fastest way to search for what you would like to watch, without consuming CPU by rendering those websites.

In my TODO list is to create a very simple website for these websites that will work even on IBrowse and AWeb pretty good and use that to search and find content, by using minimum CSS and JS. That way it will be fast and no CPU hungry.

It won't have account support though, at least not from the first release. It will support only the free content.
