Re: Porting to AmigaOS4 thread

Author: : Raziel

Date: : 2019/10/21 13:00:55

URL:

@Raziel

This one works with "sh test.sh", but will produce empty \$p in the makefile script

```
for p in plugins/*; do "strip $p -o path/$p"; done
```

Edit:

Hmm, something fishy is going on here.

With this line

```
for _plugin in plugins/*; do "echo $_plugin"; done
```

i get this output

Quote:

```
for _plugin in plugins/*; do "echo plugin"; done
T:gmake.sh.249.ZOLVUI[1]: echo plugin: not found
```

Why is my variable name cut (missing it's leading underscore) instead of it's entry read out?

And who is responsible?

I don't think it's the makefile per se, rather the temporary command in T: seem to cut my variable.

Any help appreciated...
