Thank you.

Will do and report back.

Is there anything else needed to build shared objects (apart from -fPIC, -use-dynld and sometimes -shared)?
I'm suspecting a missing switch in my linker line, probably.

Also, could you post your libc.so and libstdc++.so sizes anyway, please?

And one more thing just, to understand.

If an app uses threading, but I use -athread=single, would the app still work?

iuc -athread=single means only one thread is used, while -athread=native allows more than one thread(?)

Thank you
