Hi,
I took 2 random PNG on the net

<http://www.pngall.com/kiwi-png>

<http://www.pngall.com/photoshop-logo-png>

and tried with PPaint 7.3c and [AmiTransformator from the Alinea-Computer](#) website. (very neat little tool!)

Both resulted in 256col ILBM pictures. I could open them without problem in DPaintV AGA in e-uae on OS4.1.xFE.

I noticed however that DPaint can't load them, if the file name length exceeds 31 characters.

:)
