I did a little hardware upgrade to emulate the 4.1FE I got an I7 4770k etc.

Now aiostreams works perfectly with FFPlay with 360p30

the test was carried out on the fly to see the difference.

later I will devote myself better to emulation once the system has been configured.

The Killing ground AB3D II now works very well with E-uae with JIT enabled.

here the video for those interested in aiostreams with twitchtv.

Thanks again for your work.
