If you do it all on amigaos4, then using automake, autoconf, aclocal and so on will give you hard times. They not up2date, have issues to amiga specific pathes, and all sort of bugs.

Once project you works on, and its active project (meaning it want latest autoconf and stuff), then use crosscompiler (yeah..). On amigaos4 that all will give you stress and annoying issues which have no needs to be sorted, just compile it all on cygwin.

Maybe it possible to sort exactly those issues you have, but on crosscompiler you will have none. And having some notebook or any sort of PC with crosscompiler just only for amigaos4 are good and easy way to do porting.
