I'd need it for porting and especially autotools stuff, since that doesn't seem to work natively,

I'd love to have an easy-to-set-up environment to be able to do that.

Your sig points to zerohero's stuff, but that won't work for me.

Neither does the cygwin setup here on the site (both are missing essential program which stop me right when i want to use git or update), so i'd love to have an article where i can set up cygwin easily and just start porting after it's installation.

I'm in the process of installing all the MSYS2 stuff right now, probably can drop it then.
