Good! Thanks for tests

@Raziel

All the same. Just your SDK directory not work:SDK, but /usr/local/amiga/SDK. All directories layout inside are the same.

Once you will go into dark side of crosscompilation, you will never back :)

What you need to deal with are things i wrote in "tips&tricks, but that is for actual porting.

You can take scummvm as first test of course, and i csn help to deal with build process so you will get how to do it all
