Approx. 1h 45mins, if done completely with configure beforehand.

Yes, I know it will easily be three or more times faster on the pc, but I want to keep the build native since that should still be the ultimate aim, shouldn't it?

To have a working SDK that is able to compile such big projects.

Otherwise we can drop the whole native sdk development and let the devs focus on something else.

I do still have one question.

Does cross compiling support shared builds/objects?

I know that shared builds are turned off for the cross builds (buildbot, through a linux server) in scummvm since it does not build working binaries.
