The new versions of RadeonHD driver in the Enhancer Software v1.3 Standard (v1.21) and Plus (v2.22) are specifically designed to function with the Warp3D Nova system on the Enhancer Software and constitute a part of the cost of the Enhancer Software package. Closer integration of the software will continue. The development cost is of course significant over the years. There have been three major updates to Enhancer Software and all have been provided FREE of charge to registered users.

V1 and V2 of RadeonHD are the OLD versions of the RadeonHD driver. All new things developed and fixed in V3.x only. So, any newcomer should get exactly RadeonHD V3.x and nothing else.

With RadeonHD 1.x and 2.x, you didn't have an ability to use more than 256gb of GPU memory (kind of necessary for example for all last games I port, or instead all will go over swapping, filling all VRAM memory and then crash and burn). Taking aside all the changes and fixes done since V1.x / V2.x times.
