Hi,

Following my successful tests with XSane and HP Printer/Scanner (Thanks Edgar 😊) I'd like to try something totally new to me. Its MIDI keyboard connected to my SAM440 Flex. I have almost zero knowledge about this topic but my plan is to buy smth not expensive, with 61+ standard, dynamic keys. Maybe M Audio Keystation 61 III? The older model is reported to work with AOS4.1 and I may buy a used one(half year old).

Probably it will be only fun/hobby for me but maybe something more for my son.

I have not decided yet but I'd like to know what is important/how to connect to AmigaOne/SAM. So...

USB MIDI - does it mean its In/Out connector?

MIDI In/Out - needed if USB MIDI is present?

MIDI Thru - probably not needed to me

USB to host - ?

USB to device - ?

I tried several programs (HD-Rec, Horny, Bars n Pipes) so far but have lots of different problems. Since I have no keyboard I use SoftSyn so far...but its a topic for another thread...

Thanks 😊
