As for the size of the keyboard, 61 keys only make good sense if you or your son can play the piano, i.e. if the idea is to use your setup mainly as a traditional keyboard instrument. If, on the other hand, the plan is to use the keyboard merely to enter MIDI notes/data into a sequencer, a 61key-er is a complete waste of space and money.

The initial idea was to play piano thats why standard keys, etc... but then I thought maybe connect it to my SAM and have both worlds? The cheapest Yamaha piano has only USB to host connector, thats why this thread started 😊

I noticed almost new M-Audio Keystation 61 III for 80 euro and it would allow me and my son to learn to play and have fun with Amiga. It has USB MIDI, 1x MIDI Out and is USB compliant...

As for the rest of your post, man, I have to learn a lot 🙄 thanks for the input about Timi and Phonolith. Horny was unable to choose/use Softsyn from Depot.
