What do you mean by interface problems?

Graphic glitches?

I have run the OS4Depot/Inutilis version for years without problem on XE/X5000

EDIT: Looking at your second picture I kinda understand what you mean but that is an empty window,

I think the "dragbar" shows up once you have something to drag - a new midi-track.

But there sure can be bugs since Timo ported it from 68k to PPC.
